## Introducing

# “ 테일시터형 무인비행체 시스템 ”

수직이착륙과 고속 수평 전진비행이 가능하여  
더 빠르게, 더 멀리 비행할 수 있습니다.

구조가 단순한 만큼 더 많은 화물이나 장비를  
싣고 비행할 수 있습니다.

공기역학적 설계로 바람에 대한 적응력이 높습니  
다.

# Why Tail-sitter?

Items	Multicopter	Tilt rotor	Hybrid VTOL (Lift & Cruise)	Tail-sitter
				
Features	<ul style="list-style-type: none"> <li>Controls altitude using multiple propellers</li> <li>Most widely used</li> </ul>	<ul style="list-style-type: none"> <li>Transits from vertical to horizontal by tilting the prop direction</li> </ul>	<ul style="list-style-type: none"> <li>Fixed wing type</li> <li>Separated thruster for vertical and horizontal manoeuvres</li> </ul>	<ul style="list-style-type: none"> <li>“Sitting” on a ground using its “tail”</li> <li>Hybrid of Multicopter &amp; Fixed wing</li> </ul>
Cons	<ul style="list-style-type: none"> <li>Easy to control</li> <li>Multipurpose</li> </ul>	<ul style="list-style-type: none"> <li>Fast forward flight</li> <li>Long range &amp; endurance</li> </ul>	<ul style="list-style-type: none"> <li>Relatively easy to control</li> <li>Long range &amp; endurance</li> </ul>	<ul style="list-style-type: none"> <li>Easy to control</li> <li>Long range &amp; endurance</li> <li>Simple structure</li> </ul>
Pros	<ul style="list-style-type: none"> <li>Short range &amp; endurance</li> <li>Low speed</li> <li>Low payload</li> </ul>	<ul style="list-style-type: none"> <li>Complex structure for tilting thruster</li> <li>Hard to control</li> </ul>	<ul style="list-style-type: none"> <li>Low payload</li> <li>Low aerodynamic efficiency</li> </ul>	<ul style="list-style-type: none"> <li>Less stable in vertical flight mode</li> <li>Transition flight</li> <li>Loading cargo</li> </ul>

# Tail-sitter Products

## FALCONET (NDV-P01)

- ✓ Small-size Tail-sitter
- ✓ ISR OP/Light Armed

**PAYLOAD** 1kg

**CRUISE SPEED** 60km/h

**RANGE** >40km

**ENDURANCE** >1Hr

**REMARKS** Launching in Oct '22

## KESTREL (NDV-P05)

- ✓ Small-size Tail-sitter
- ✓ ISR OP/Delivery

**PAYLOAD** 5kg

**CRUISE SPEED** 80km/h

**RANGE** >60km

**ENDURANCE** >2Hr

**REMARKS** Launching in Oct '22

## ORCA (NDV-P20)

- ✓ Mid-size Tail-sitter
- ✓ ER ISR OP/Delivery

**PAYLOAD** 20kg

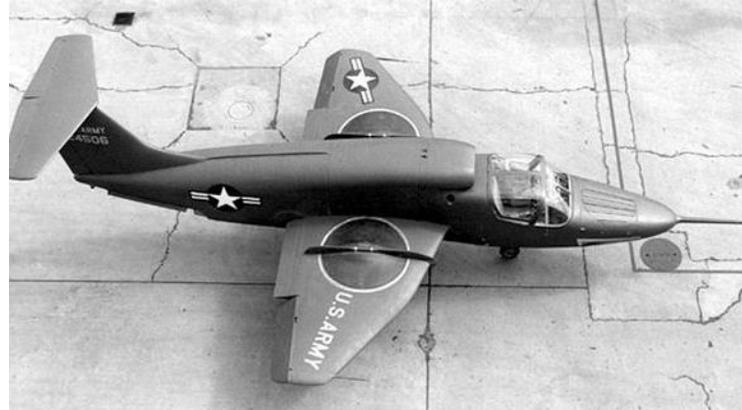

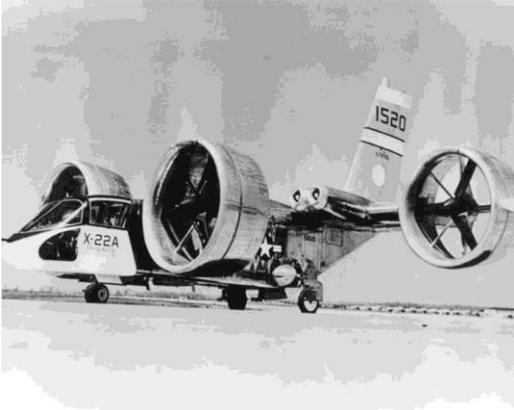

**CRUISE SPEED** 108km/h

**RANGE** >80km

**ENDURANCE** >6Hr

**REMARKS** Under Development

# Ducted Propulsion System

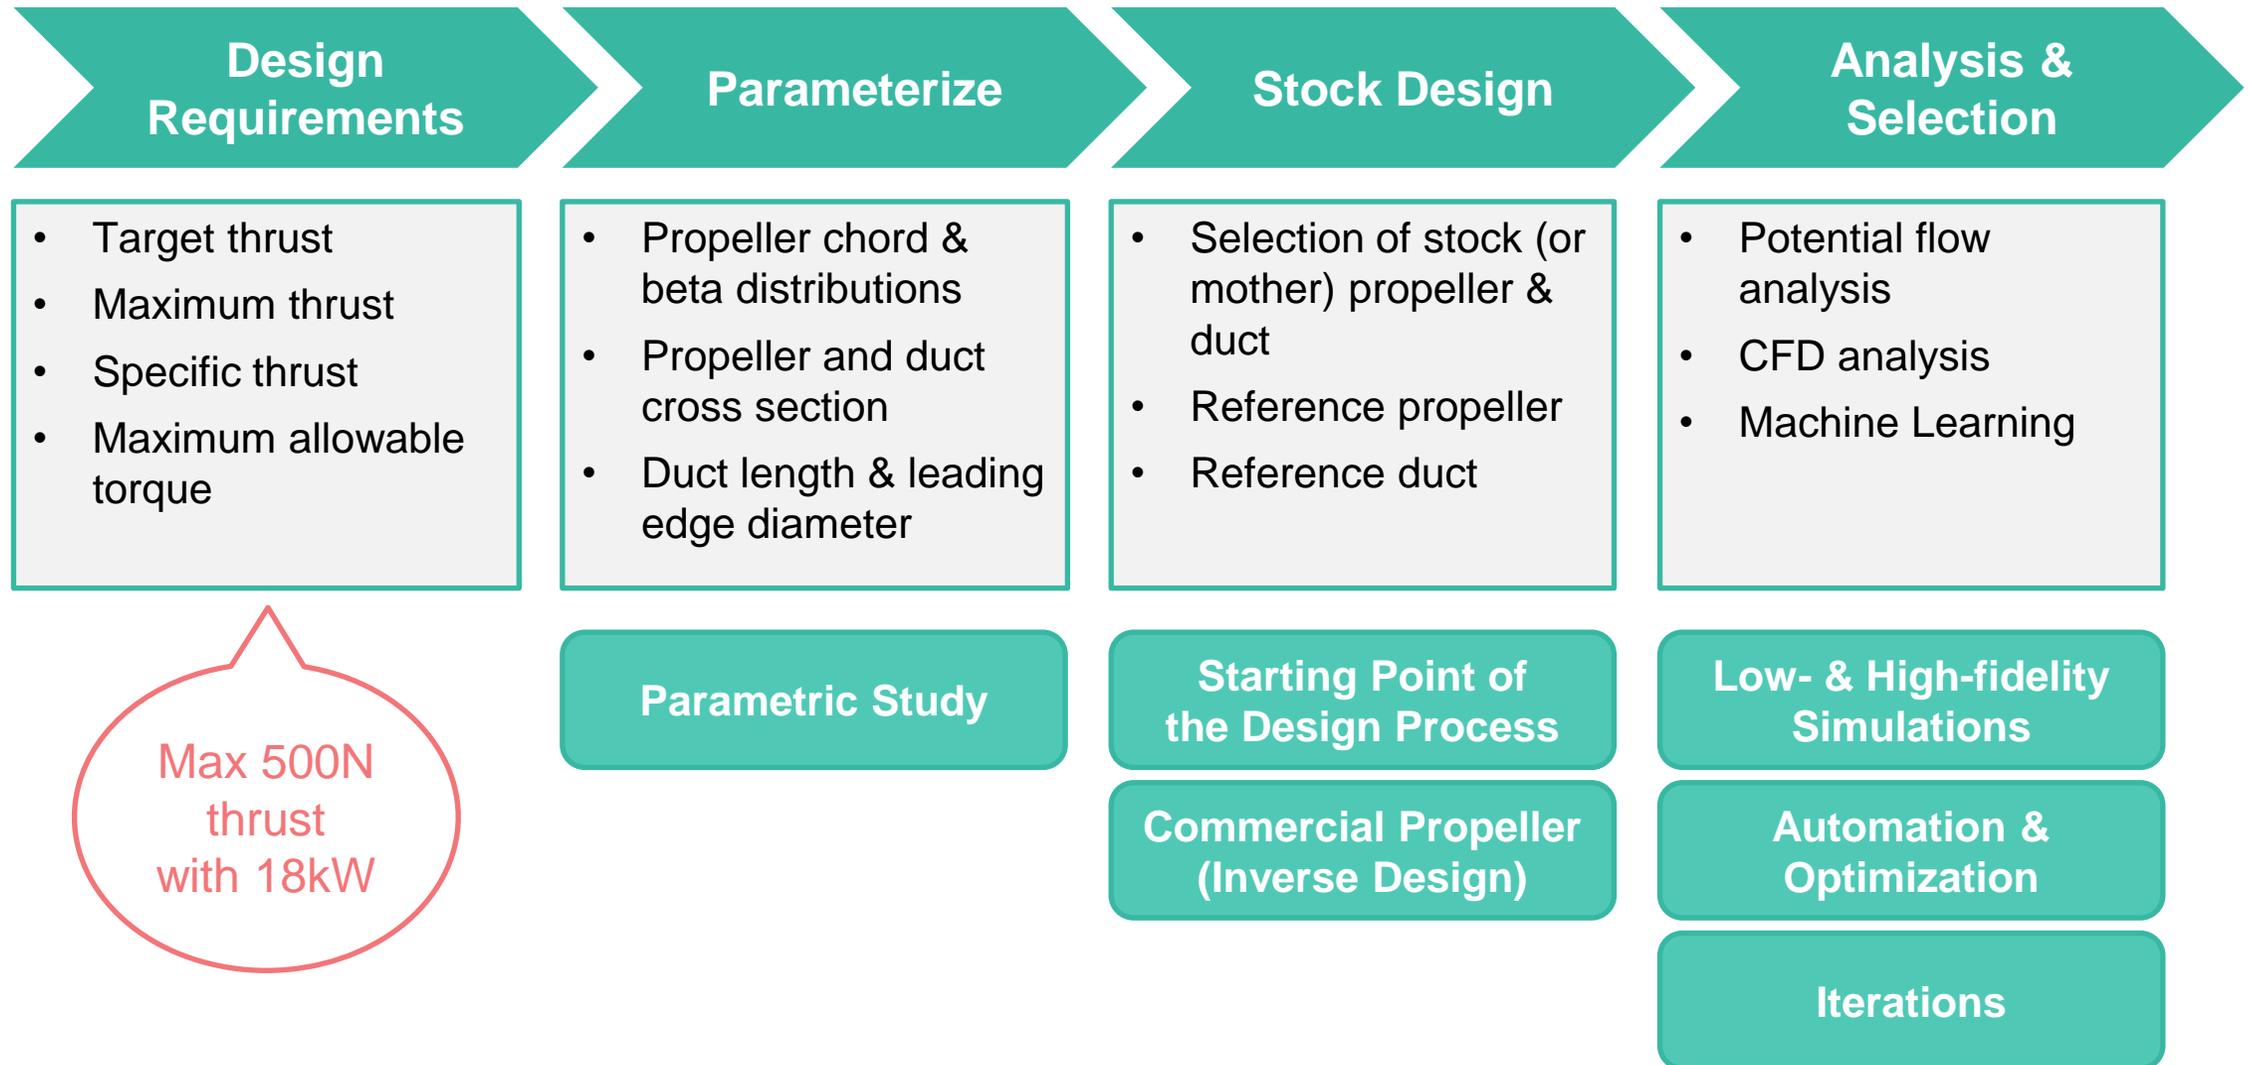

## ADVANTAGES

- Reducing tip losses - **more efficient** at low speed
- **Smaller diameter** for the same static thrust
- **Quieter** than the open propeller
- Enhanced **safety** on the ground

## DISADVANTAGES

- **Less efficient** at cruise
- Requires very **small gap** between blade and duct
- Requires **high RPM** and **minimal vibration**
- Complex duct design and **weight increase**
- **Duct stalls** at high angle of attack
- Produces **aerodynamic drag**

# Overall Design Procedure

## Solver

OpenFOAM®

## Low-fidelity Simulation

- Open and ducted propeller analysis tools
- Potential flow theory
- M, Drela & H. Youngren

## Machine Learning Framework

## Automation

## Computing H/W

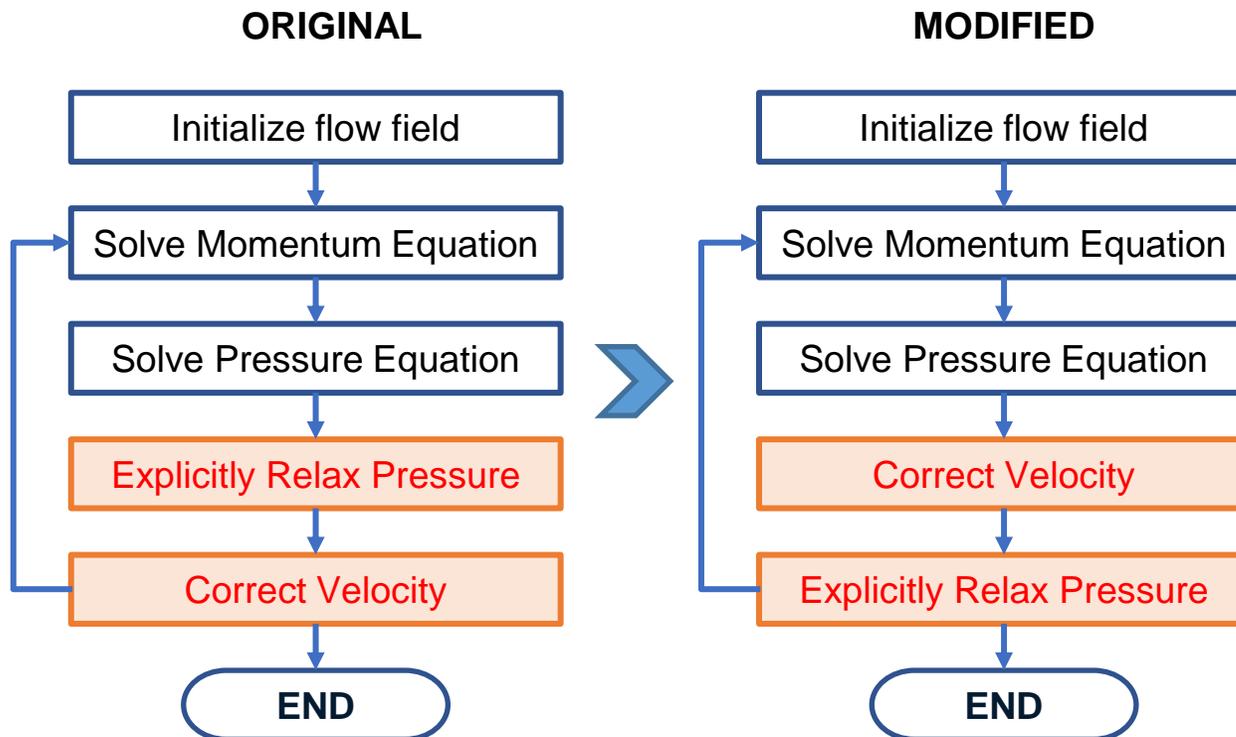

## Simulation Methods

- MRF for initialize flow field
- Transient simulation by using rotating body
- Artificial mesh interface

# Numerical Methods

Revision on the OpenFOAM – Pressure-velocity Coupling & Matrix Solver

## Pressure relaxation In PIMPLE ALGORITHM of the OpenFOAM

## Matrix Diagonal Dominance

`Ueqn.relax();` VS `Ueqn.relax(1.0);`

- Does not relax the matrix at PIMPLE final iteration

- Relax the matrix by using the relaxation factor 1.0
- Ensure the diagonal dominance

Effective for poor quality grids  
(But good grid first!)

# Numerical Methods

## Revision on the OpenFOAM – TRANSIMPLE (Transient SIMPLE)

PIMPLE algorithm of the OpenFOAM tightly solve the matrix at every corrector steps. This is quite time consuming process.

Solve the governing equations to meet relative tolerance at every inner iterations but the final iteration step: Solver solves the matrix until it meets the absolute tolerance without relaxing the matrix.

```

if (transimple)
{
    p_rghEqn.solve(mesh.solver(p_rgh.select(pimple.finalIter())));
}
else
{
    p_rghEqn.solve(mesh.solver(p_rgh.select(pimple.finalInnerIter())));
}

```

# Numerical Methods

## Revision on the OpenFOAM – Deferred Correction

Diagonal dominant matrix  
→ important for a stable and robust simulation

Deferred correction<sup>1</sup> is an iterative but good way to improve the solver robustness.

$$\frac{\partial u}{\partial t} + (\nabla \cdot uu)_{IM}^{HOS}$$

$$\frac{\partial u}{\partial t} + (\nabla \cdot uu)_{IM}^{LOS} + (\nabla \cdot uu)_{EX}^{HOS} - (\nabla \cdot uu)_{EX}^{LOS}$$

Source terms

In the source code of the momentum equations,

### ORG

```
fvVectorMatrix UEqn
(
    fvm::ddt(rho, U)
    // + fvm::div(rhoPhi, U)
    + MRF.DDt(rho, U)
    + turbulence->divDevRhoReff(rho, U)
    ==
    fvOptions(rho, U)
);
```

### MOD

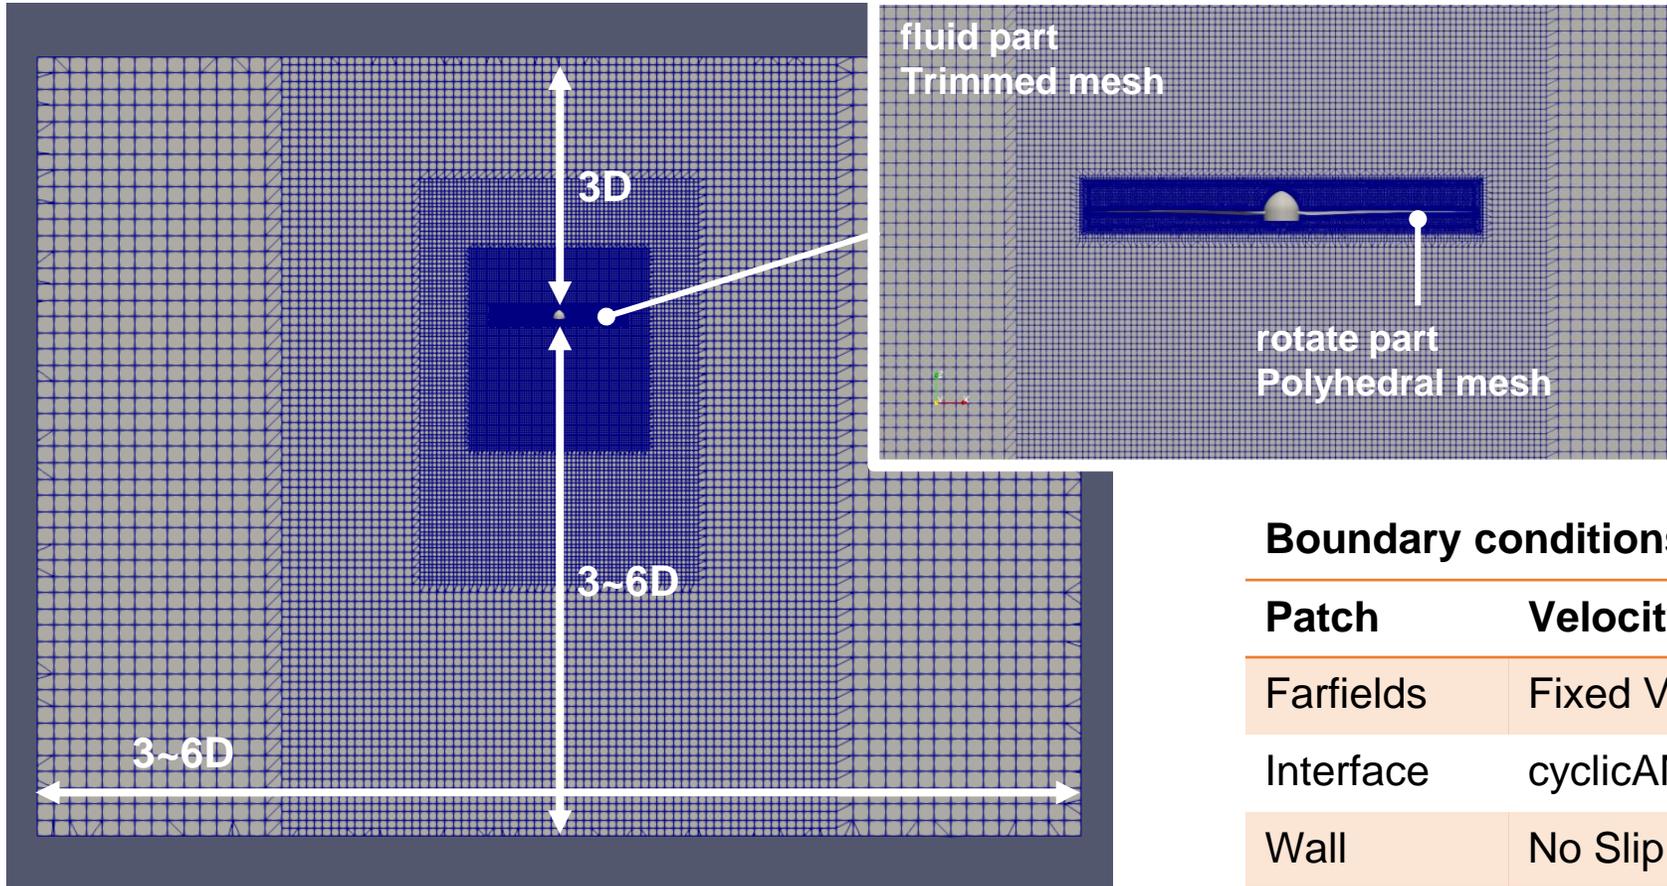

```
//-----
// deferred correction
Switch deferredCorr
(
    pimple.dict().lookupOrDefault<Switch>("deferredCorr", "off")
);

if (deferredCorr)

# Duct Design

## Parametric Study

- Total 2,175 cases were evaluated
- Steady RANS simulation with k-omega SST turbulence model
- Momentum source method was used for reflecting the effect of a propeller

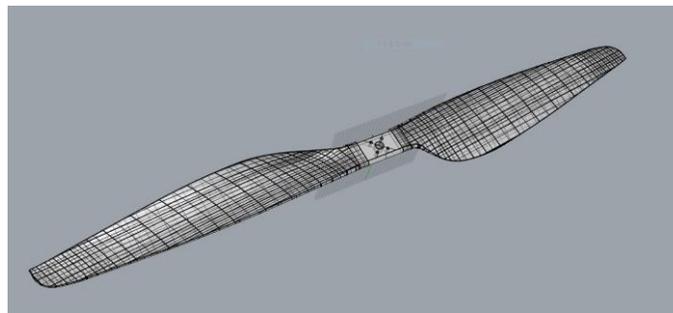

# Propeller Design

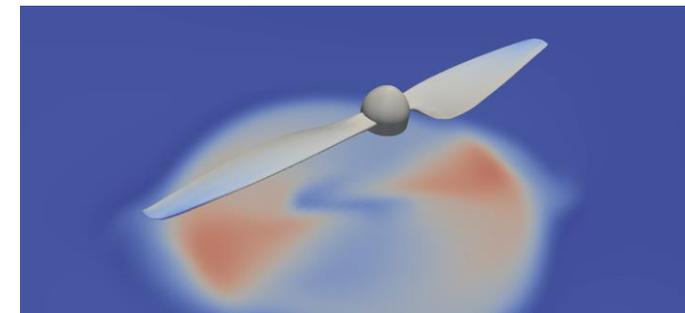

## Stock Design

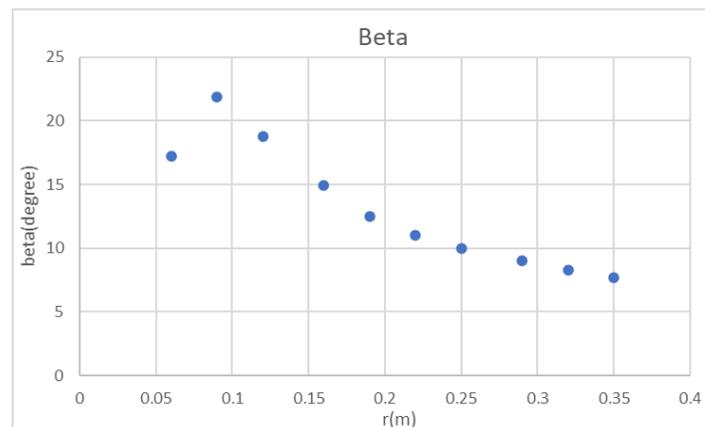

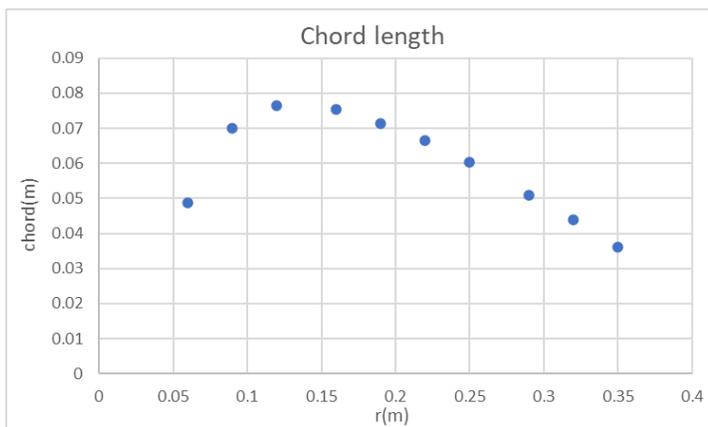

T-motor G30x10.5 Propeller

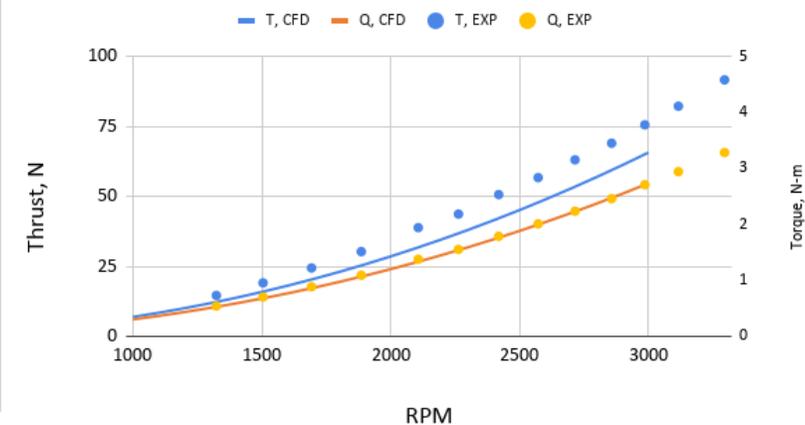

3D Scanned Geometry

CFD Simulation

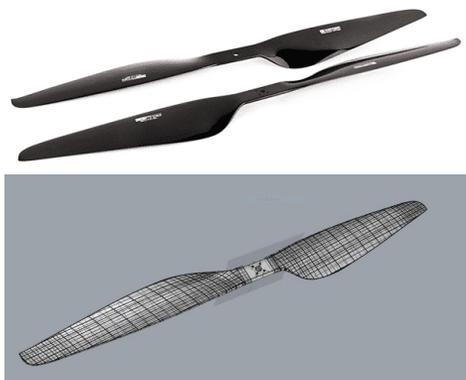

CFD Comparison

# Propeller Design

Evolution of the propeller design

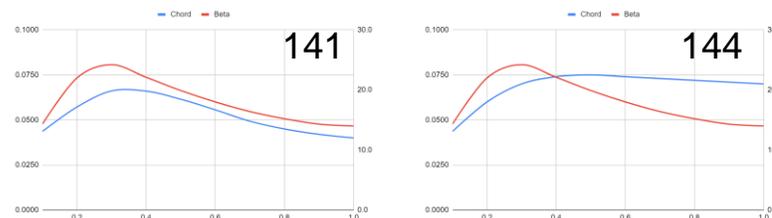

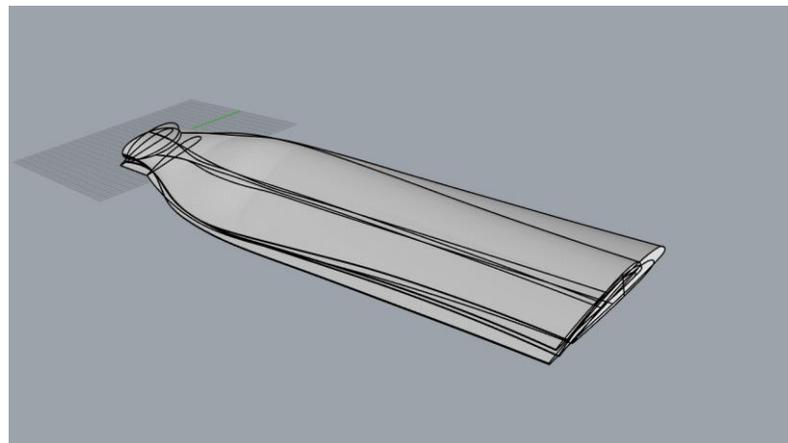

## STOCK PROPELLER

Computational Fluid  
Dynamics

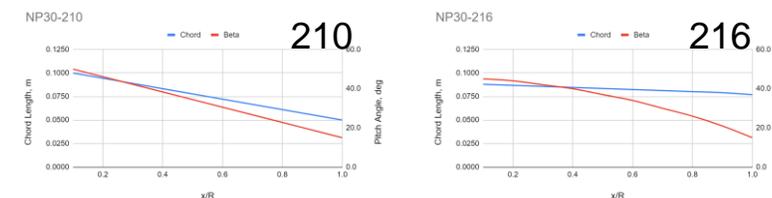

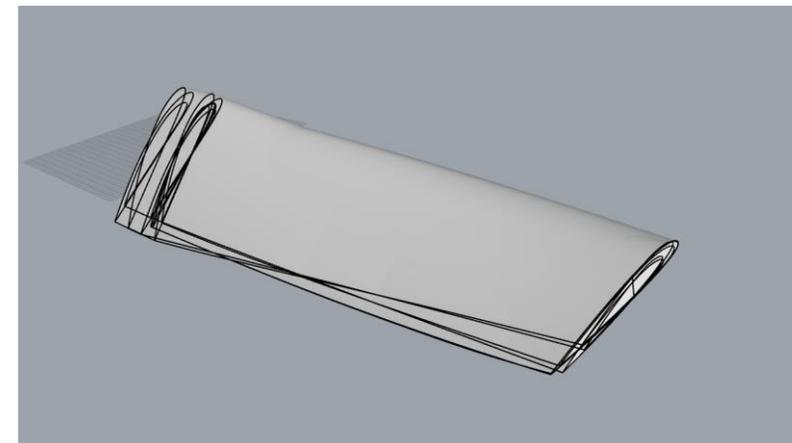

- Validation of the computational method
- Propeller characteristics

## Generation 1

- Commercial propeller based variation
- Increased tip loading

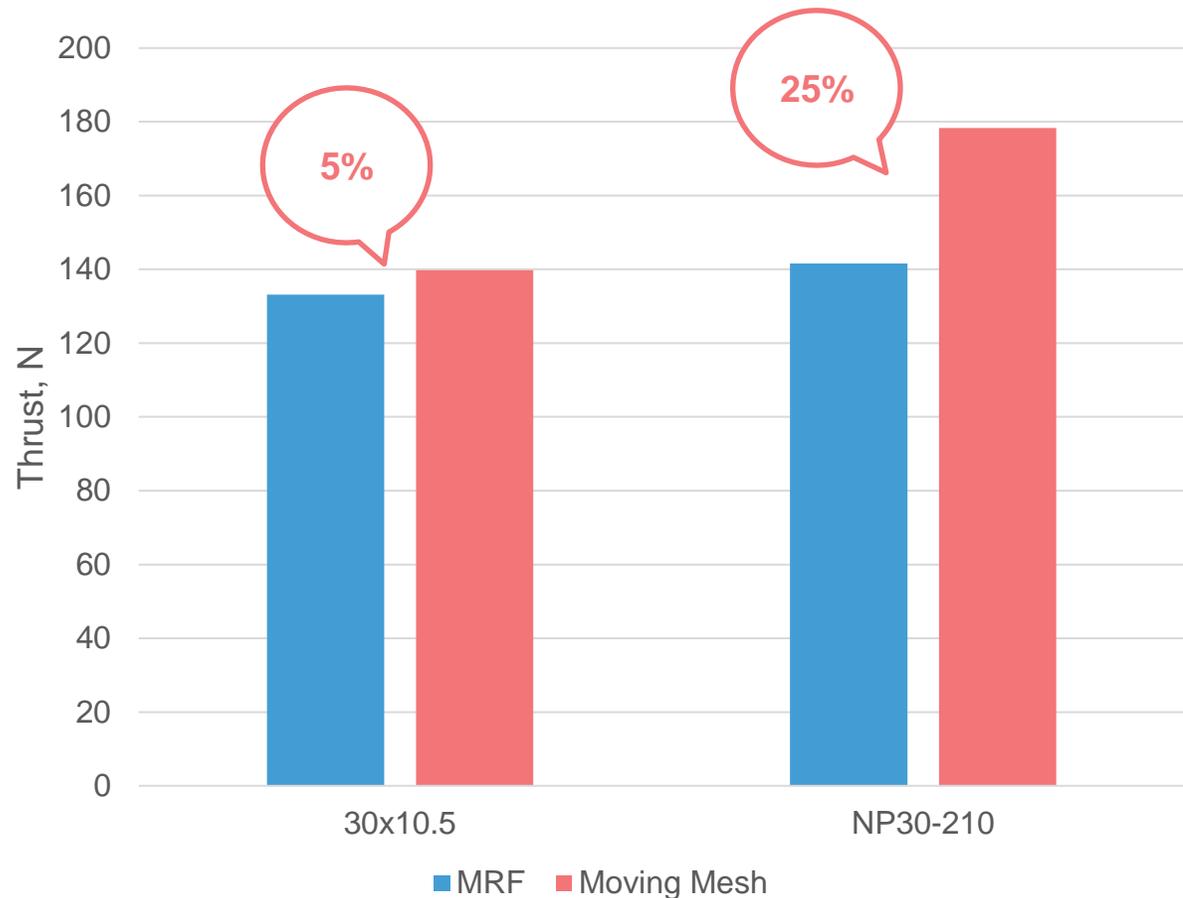

## Generation 2

- Gradually increasing blade loading
- Increased total thrust

# Propeller Design

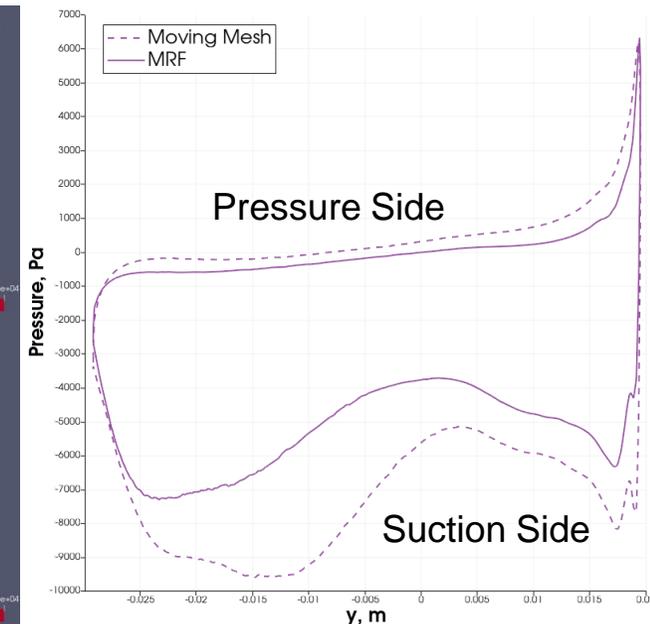

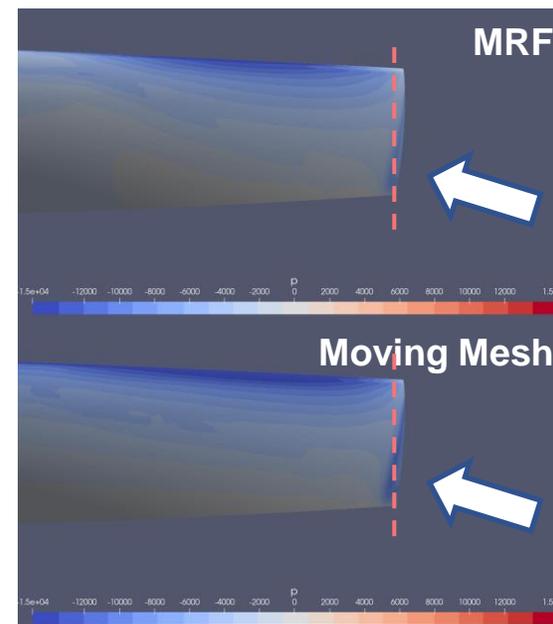

## Remarks on the MRF & Moving Mesh on Propeller Simulations

Why are the MRF and Moving Mesh results so different?

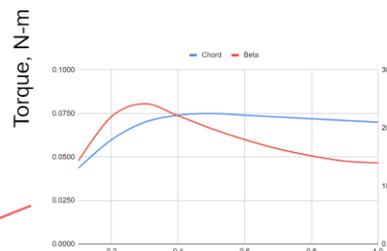

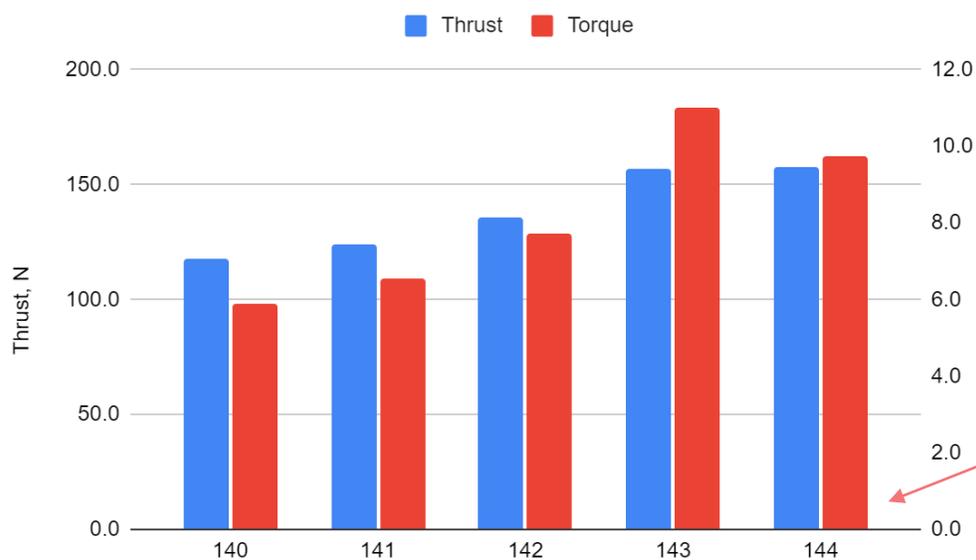

### [Hypothesis]

MRF and Moving Mesh predict the tip vortical flow structure differently.

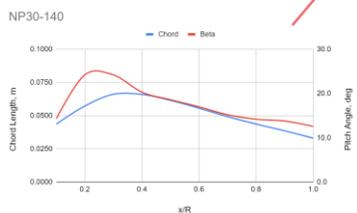

# Propeller Design

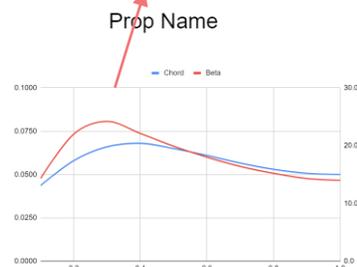

Numerical simulations on the propeller

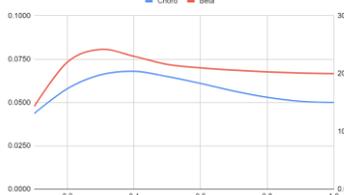

142 variation  
Increased chord

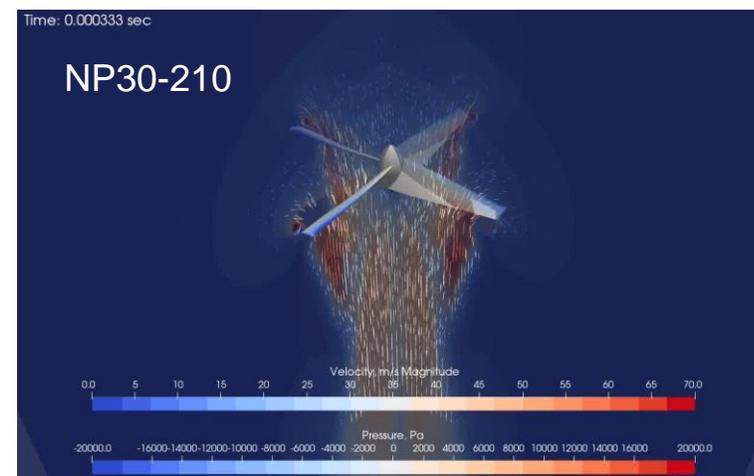

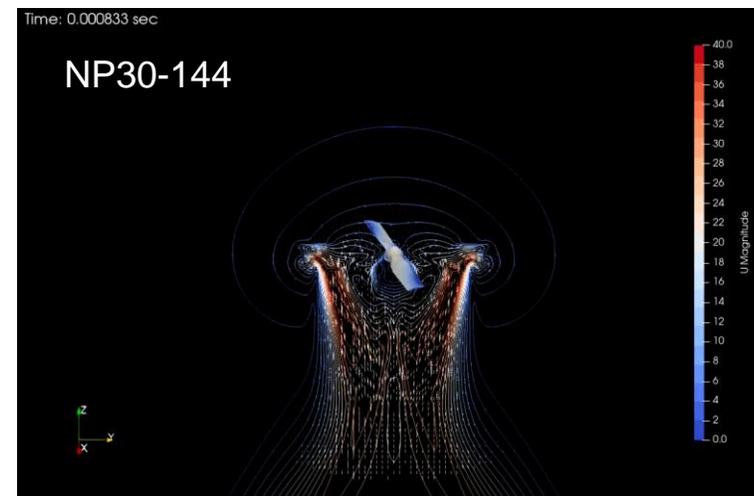

Optimum design derived from  
30x10.5 commercial propeller  
using potential code

Redistributed blade  
angle & extended  
chord length at tip

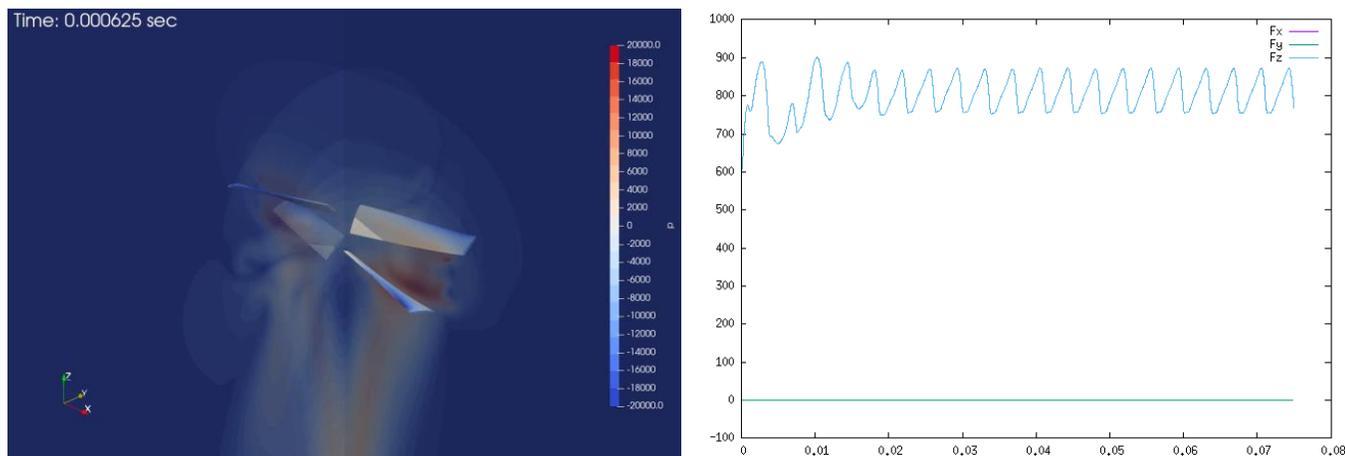

142 variation  
Higher beta

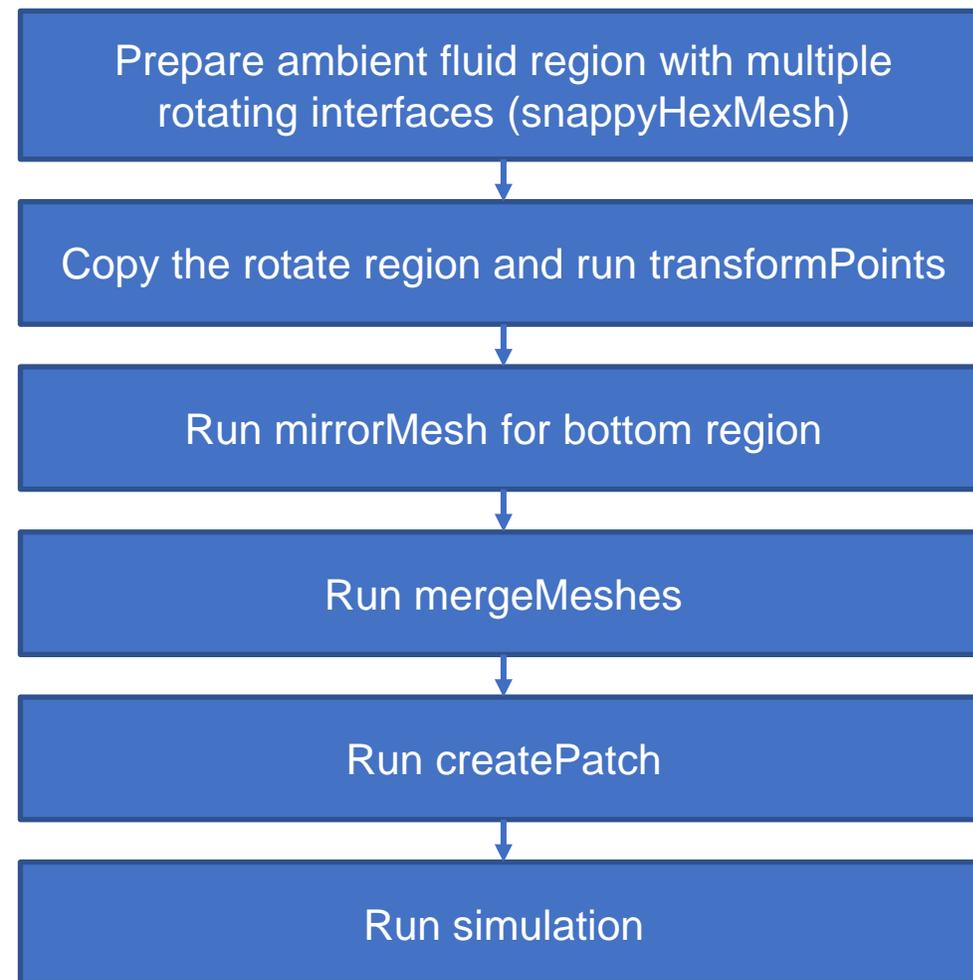

# Various Configurations

## Counter-rotating Configuration

		Thrust [N]	Torque [N-m]	S.Thrust [g/W]
	<b>4-Blade</b>	670.40	64.24	2.54
<b>Counter-rotating</b>	<b>Top</b>	371.67	33.14	2.73
	<b>Bottom</b>	436.64	42.01	2.53
	<b>Total</b>	808.32	75.15	2.62

## Pre-processing

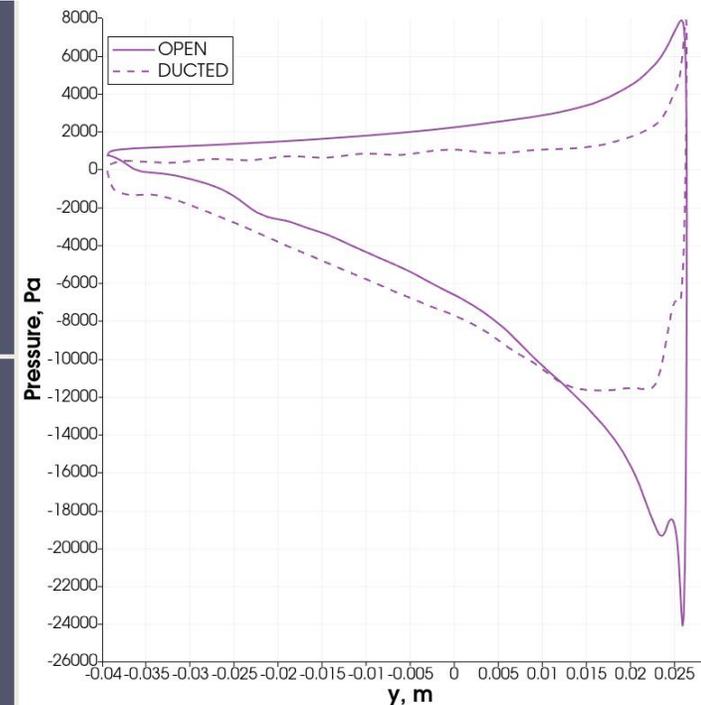

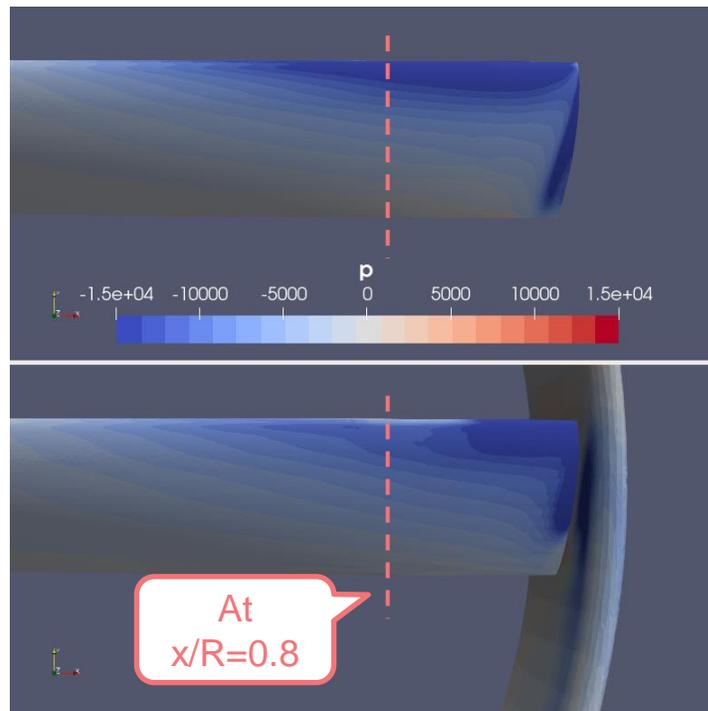

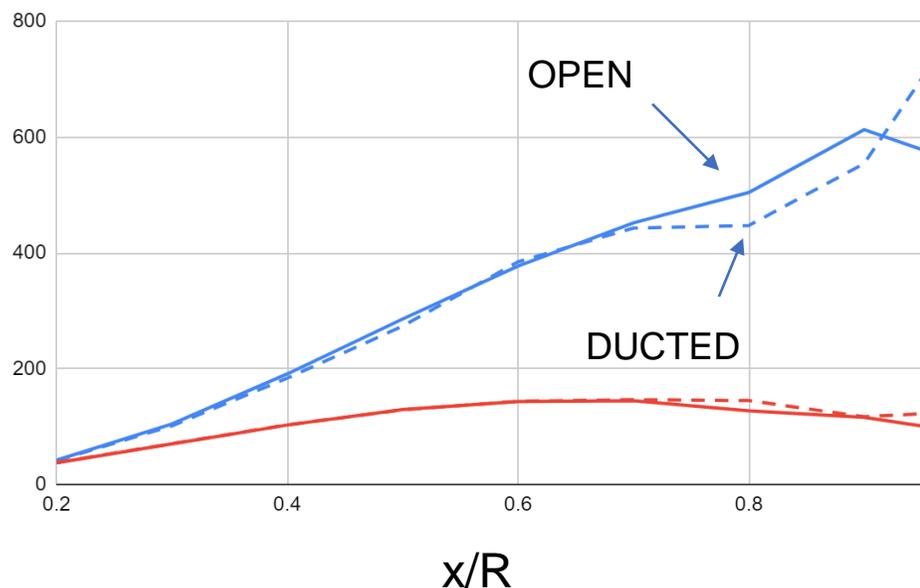

# Ducted Propeller Simulations

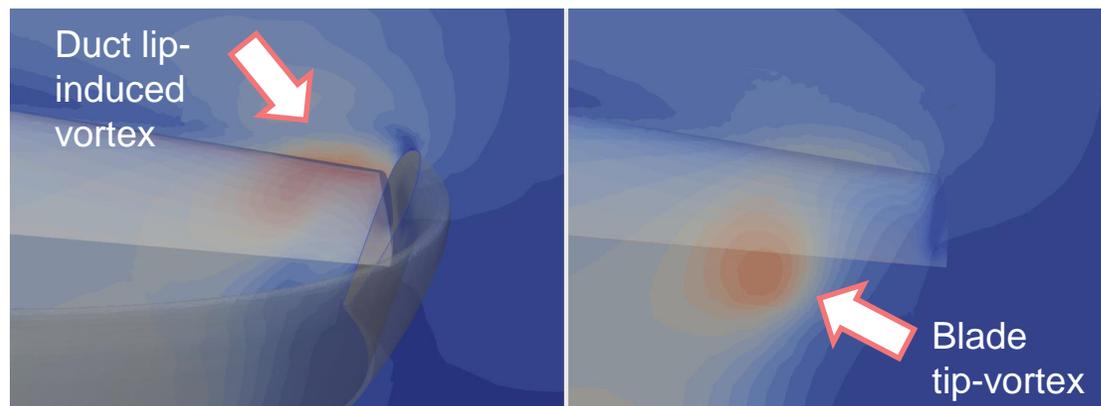

# Ducted Propeller Simulations

## Sectional thrust and torque P210-OPEN & D103

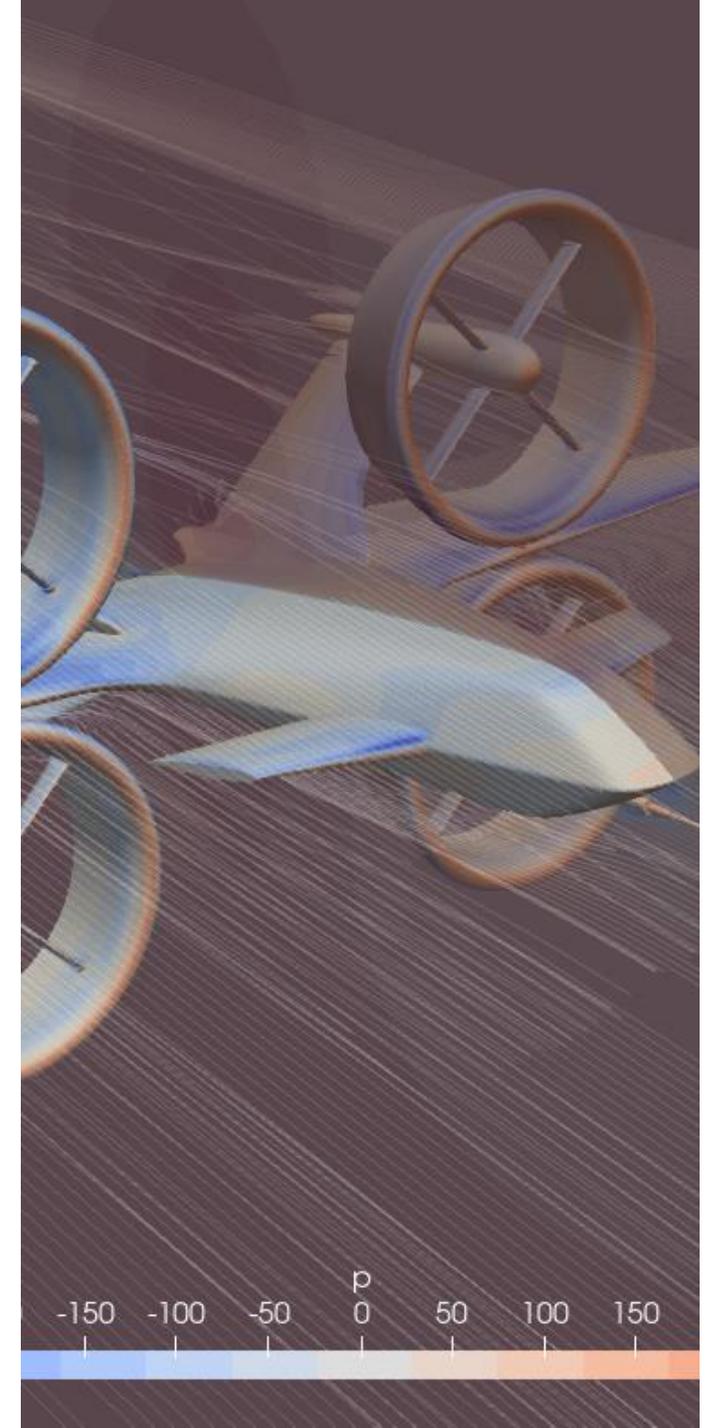

- The interaction between duct lip and propeller generates a vortical flow
- Such a vortical flow was observed to lower the sectional lift which causes thrust loss
- And the vortical flow might adversely effect on the noise performance

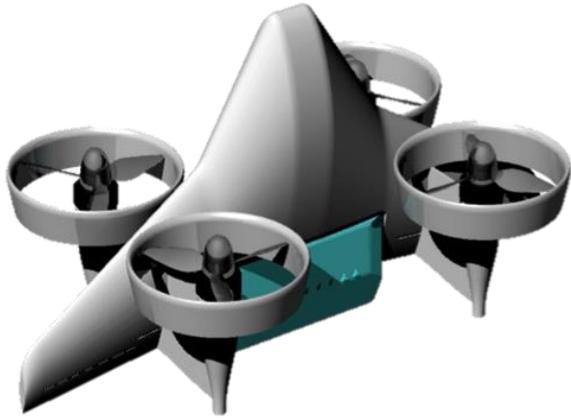

## Concluding Remarks

- Design of a ducted propeller system for a tail-sitter UAV has been performed by using the CFD techniques
- Following methods have been applied
  - Potential codes, such as XROTOR and DFDC
  - Star-CCM+ was used for mesh generation
  - Modified OpenFOAM solvers were used to predict the performance of ducted propellers
- For the duct design, over 2,000 cases were investigated by using the simplified numerical simulations
- As a reference propeller, a commercial propeller was scanned and used
- MRF and Moving Mesh methods were used to evaluate the propeller performance
- Finally, a combination of a duct (D103) and propeller (NP30-215) was selected that meets the design requirement.

# Future Works

Initial Design

Generation 1 (Present)

Generation 2 (Developing)

- Interaction between the tail-sitter UAV and ducted propeller system
- Duct design optimization over whole flight envelop (including vertical and horizontal flights)
- Pitch control system for a ducted propeller
- Noise reduction design (both blade and duct)
